

Data Analysis – Strategic Summary

Andressa Schwartzaupt Chaves

1. Approach

The analysis was developed based on a database containing 602 candidates distributed across multiple hiring stages. The objective was to identify the main hiring patterns, conversion drivers, and operational bottlenecks affecting recruitment performance.

To improve consistency, the data was organized by work model, sourcing channel, recruiter, department, role, and seniority. One important decision was separating job titles from departments, since some records mixed functions such as “TA Specialist” and “People BP” with organizational areas. This standardization improved the reliability of the analysis.

A hiring funnel was then created to evaluate candidate progression from sourcing to hiring. The analysis focused not only on hiring volume, but mainly on conversion efficiency, allowing a better understanding of which strategies and profiles generated the strongest outcomes.

2. Key Insights

2.1 Funnel

Stage	Candidates
Sourced	602
Screening	310
Interview/Test	180
Offer	65
Hired	49

The overall hiring conversion rate was approximately 8.1%. The largest candidate loss happened during the early stages of the process, especially due to “no response” and salary mismatch. This suggests that the main operational challenge is candidate engagement rather than technical evaluation.

Another important finding is that 16 candidates received offers but were not ultimately hired. The database did not provide a structured rejection reason for these cases, only recruiter notes and observations. Based on probability and hiring market behavior, it is

likely that these candidates declined the offer due to salary expectations, career timing, competing opportunities, or lack of cultural alignment.

This insight is particularly relevant because late-stage losses generate high operational cost, since these candidates had already progressed through most of the hiring funnel. Reducing offer declines could therefore create a meaningful improvement in final hiring conversion.

2.2 Work Model

Work Model	Conversion Rate
Híbrido	≈ 10.7%
Presencial	≈ 8.1%
Remoto	≈ 6.7%

Hybrid roles generated the highest conversion rate, indicating that flexibility combined with organizational structure may create stronger hiring alignment than fully remote opportunities.

2.3 Source Channels

Channel	Conversion Rate
Github	≈ 11.0%
Inbound	≈ 10.1%
Hunting	≈ 9.3%
LinkedIn	≈ 8.6%
Indicação	≈ 5.3%

Github and Inbound produced the strongest results, suggesting that technically engaged and intentionally interested candidates convert more efficiently than high-volume sourcing channels.

2.4 Seniority

Seniority	Conversion Rate
Staff	≈ 13.5%
Senior	≈ 8.9%
Pleno	≈ 6.7%
Junior	≈ 4.4%

The analysis showed a clear relationship between seniority and hiring success. More experienced candidates progressed through the funnel more efficiently, likely due to stronger alignment, lower evaluation risk, and greater professional maturity.

2.5 Recruiters

Recruiter	Conversion Rate
Bruno	≈ 15.3%
Ana	≈ 13.3%
Carla	≈ 8.9%
Gustavo	≈ 5.0%
Diego	≈ 4.9%

Recruiter performance varied significantly across the dataset, indicating opportunities for stronger process standardization and sharing of best practices.

2.6 Departments & Roles

Department	Conversion Rate
People	≈ 8.7%
Data	≈ 6.8%

People-related roles showed stronger hiring conversion than Data positions, likely because technical roles face higher market competition and scarcity. A critical insight was the low conversion rate for Talent Acquisition Specialist positions despite high candidate volume, suggesting possible salary mismatch or role-positioning issues.

3. Decisions Made

The analysis prioritized conversion efficiency instead of absolute hiring volume in order to identify the strategies generating the strongest hiring outcomes. Based on the results, channels such as Github and Inbound were treated as higher-priority sourcing strategies because they consistently outperformed broader sourcing platforms.

The analysis also highlighted Senior and Staff candidates as the profiles with the strongest hiring efficiency, reinforcing the importance of experience level in hiring success.

In addition, special attention was given to early-stage funnel losses because “no response” and salary mismatch represented the largest operational bottlenecks. Improving these stages would likely generate the highest short-term impact on hiring conversion.

4. Use of AI

For this analysis, ChatGPT was used as a support tool to improve the interpretation of the raw analysis and the dynamic charts created in Excel, helping transform operational findings into more strategic insights.

The tool also supported the organization of ideas, refinement of explanations, and correction of subtle grammatical issues throughout the document, improving clarity and readability while maintaining the original analytical reasoning.

Current experience with AI also includes ATS platforms such as Inhire and tools like Microsoft Responsible AI Toolkit. These solutions can support recruiting operations through reporting automation, candidate communication, funnel analysis, and personalized follow-ups.

This is particularly relevant because the largest bottleneck identified in the process was candidate disengagement during the early stages of the funnel. In this context, AI can help

improve engagement consistency and recruiter productivity without significantly increasing operational workload.

Although the current experience with AI is still evolving, the analysis demonstrates practical readiness to apply AI solutions in a scalable and operationally efficient way.

5. Final Recommendations

- Prioritize high-conversion sourcing channels such as Github and Inbound.
- Improve candidate engagement during the first stages of the funnel.
- Review salary alignment for critical roles.
- Standardize recruiter best practices.
- Use AI tools to automate follow-ups and reporting.
- Maintain focus on senior and staff hiring for higher operational efficiency.

Overall, the analysis demonstrates that hiring success depends more on sourcing quality, candidate engagement, and process efficiency than on hiring volume alone.
